AB The present invention relates to fluorescent compds. of formulas (I), (II), or (III), a process for their preparation and their use for the preparation of inks, colorants, pigmented plastics for coatings, non-impact-printing material, color filters, cosmetics, polymeric ink particles, toners, as fluorescent tracers, in color changing media, dye lasers and electroluminescent devices. A luminescent device comprising a compound according to the present invention is high in the efficiency of elec. energy utilization and high in luminance.

AB Synthetic methodologies leading toward 2,3,5-triaryl- and 2,3,5,6-tetraaryl-2,5-dihydropyrrolo[3,4-c]pyrrole-1,4-diones (tri- and tetra-aryl-DPPs), e.g., I, and their derivs. have been investigated. Direct arylation of 3,6-diphenyl-DPP was possible using 1-fluoro-2,4-dinitrobenzene. Acylation of Et 2-aryl-4,5-dihydro-5-oxopyrrole-3-carboxylates with N-aryl benzimidoyl chlorides in the presence of a strong base gave the 2,3,6-triaryl-DPPs together with the corresponding uncyclized enamines. A simple method for the synthesis of Et 1,2-diaryl-4,5-dihydro-5-oxopyrrole-3-carboxylates has led to an alternative route to triaryl-DPPs via reaction with benzonitrile under basic conditions, and combination of this with the benzimidoyl chloride methodol. has enabled the synthesis of variously substituted 2,3,5,6-tetraphenyl-DPPs.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The invention relates to a process for the preparation of furopyrroles I, comprising (a) heating a compound II under microwave irradiation, optionally in the presence of an inert solvent [wherein A1 and A2 are C1-C18 alkyl, C2-C18 alkenyl, C2-C18 alkynyl, C5-C8 cycloalkyl, C5-C8 cycloalkenyl, aryl, or heteroaryl; A3 is H, C1-C18 alkyl, cyanomethyl, Ar3, -CR3OR31-(CH2)m-Ar3, or -Y-R32, wherein R30 and R31 independently stand for H or C1-C4 alkyl, or Ph which can be substituted up to three times with C1-C4 alkyl, Ar3 is aryl, C5-C8 cycloalkyl, C5-C8 cycloalkenyl, or heteroaryl, which can be substituted one to three times with C1-C8 alkyl, C1-C8 alkoxy, halogen, or Ph, which can be substituted with C1-C8 alkyl or C1-C8 alkoxy 1-3 times; m is 0, 1, 2, 3, or 4; R is C1-C18 alkyl, in particular C1-C4 alkyl, aryl, in particular Ph, or aralkyl, in particular benzyl, which can be substituted one to three times with C1-C8 alkyl, C1-C8 alkoxy, or halogen; Y is C(O), C(O)O, C(O)NH, SO2NH, or SO2; and R32 is C1-C18 alkyl, Ar3, or aralkyl]. Claims also cover diketopyrrolopyrroles (DPPs) III [A4 = H], the preparation of III [A4 = C1-C18 alkyl or Ar3] by reaction of I with primary amines A4-NH2, and an addnl. preparation of III [A4 = H]. I can be obtained in high yield and high purity.

The microwave-assisted process, optionally in the presence of an inert solvent, is rapid and economical. Previously, WO03022848 disclosed a process for the preparation of I, comprising heating a compound II in an inert solvent, such as aromatic solvents, like biphenyl, para-, meta- or ortho-terphenyl, dibenzyltoluene, α -methyl- or β -methylnaphthalene, cyclic carbonates like 1,3-dioxolan-2-one, ketones like acetophenone or benzophenone, γ -butyrolactone, and ethylene glycols like Phe-Cellosolve or Bu-Cellosolve, or mixts. thereof, in particular mixts. of di- and triaryl ethers (Dowtherm A). It was discovered that I can be obtained in higher yield by carrying out the above reaction under microwave radiation. The yield of the desired ring closure reaction, e.g., of Et 4-benzoyl-4,5-dihydro-5-oxo-2-phenylpyrrole-3-carboxylate (IV) to give 3,6-diphenylfuro[3,4-c]pyrrole-1,4-dione (V), is, for example, increased from 40% to 86% by microwave assistance. Moreover, the preparation of the latter lactone (a versatile DPP precursor) requires less time (1-10 min) under microwave irradiation, whereas it takes 60 h when conducted without microwave radiation (conventional method). In addition, the solvent can be

L4 ANSWER 3 OF 8 HCPLUS COPYRIGHT 2007 ACS on STN (Continued)
omitted in the microwave-assisted ring closure, which makes the process even more cost-effective. For instance, 0.296 mmol IV was irradiated with microwave radiation at 2-45 GHz and forward power 300 W without solvent, heating to 250° for 10 min. The crude product V was allowed to cool, triturated, filtered, and washed with MeOH (86% yield). The DPP compd. VI was prep'd. in 52% yield by condensation of the corresponding lactone (i.e., an analog of V) with PhNH2 in the presence of CF3CO2H and DCC at room temp. Finally, 5-oxo-4,5-dihydrofuran-3-carboxylates react with primary amines to give corresponding pyrrole derivs., which then react with nitriles A2-CN to give compds. III [A4 = H].

AB Et 2-aryl-4,5-dihydro-5-oxopyrrole-3-carboxylates, I (R = Ph, 4-C1C6H4) react with esters or acyl halides in the presence of a strong base to give 4-acyl derivs., e.g. II, which exist predominantly as either E- or Z-enols. These are cyclized, either in solution at temps. >200°C or by microwave irradiation, to 3,6-disubstituted 1H-furo[3,4-c]pyrrolediones, e.g. III, which, after N-protection, are convertible by reaction with primary amines into novel N,N'-disubstituted DPP derivs., e.g. IV.

AB Title compds. [I; R1, R2 = (substituted) (heterocyclic) aryl], were prepared by (a) heating a disuccinate with R1CN or R2CN or a mixture thereof in an organic solvent in the presence of a particle growth regulator, (b) conditioning the intermediate condensation product in H₂O or a mixture of H₂O and a H₂O-miscellaneous solvent, optionally in the presence of an inorg. acid, and (c) optionally conditioning the product of step (b) in an aprotic solvent. The obtained DPPs possess a higher color strength, a higher chroma, a purer shade and a higher opacity vs. corresponding com. available DPPs. Thus, a mixture of Na in tert-amyl alc. was heated to 130° followed by addition of FeCl₃, 4-chlorobenzonitrile, 4-isopropoxybenzonitrile (preparation given), diisopropyl succinate, and tert-amyl alc. over 2 h. The temperature was decreased to 85°, stirred 2 h, cooled to 40°, and transferred over 30 min. to a mixture of H₂O and MeOH. The mixture was refluxed 18 h to give 75% C.I. pigment red 254, which was further conditioned by heating in Dowtherm E for 5 h at 160° to give a red pigment with a purer, brighter, yellower shade and a slightly higher opacity.

AB Synthetic methodologies leading toward 2,3,5-triaryl- and 2,3,5,6-tetraaryl-2,5-dihydropyrrolo[3,4-c]pyrrole-1,4-diones (tri- and tetra-aryl-DPPs), e.g., I, and their derivs. have been investigated. Direct arylation of 3,6-diphenyl-DPP was possible using 1-fluoro-2,4-dinitrobenzene. Acylation of Et 2-aryl-4,5-dihydro-5-oxopyrrole-3-carboxylates with N-aryl benzimidoyl chlorides in the presence of a strong base gave the 2,3,6-triaryl-DPPs together with the corresponding uncyclized enamines. A simple method for the synthesis of Et 1,2-diaryl-4,5-dihydro-5-oxopyrrole-3-carboxylates has led to an alternative route to triaryl-DPPs via reaction with benzonitrile under basic conditions, and combination of this with the benzimidoyl chloride methodol has enabled the synthesis of variously substituted 2,3,5,6-tetraphenyl-DPPs.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The invention relates to a process for the preparation of furopyrroles I, comprising (a) heating a compound II under microwave irradiation, optionally in the presence of an inert solvent (wherein A1 and A2 are C1-C18 alkyl, C2-C18 alkenyl, C5-C8 cycloalkyl, C5-C8 cycloalkenyl, aryl, or heteroaryl; A3 is H, C1-C18 alkyl, cyanomethyl, Ar3, -CR30R31-(CH2)m-Ar3, or -Y-R32, wherein R30 and R31 independently stand for H or C1-C4 alkyl, or Ph which can be substituted up to three times with C1-C4 alkyl; Ar3 is aryl, C5-C8 cycloalkyl, C5-C8 cycloalkenyl, or heteroaryl, which can be substituted one to three times with C1-C8 alkyl, C1-C8 alkoxy, halogen, or Ph, which can be substituted with C1-C8 alkyl or C1-C8 alkoxy 1-3 times; m is 0, 1, 2, 3, or 4; R is C1-C18 alkyl, in particular C1-C4 alkyl, aryl, in particular Ph, or aralkyl, in particular benzyl, which can be substituted one to three times with C1-C8 alkyl, C1-C8 alkoxy, or halogen; Y is C(O), C(O)O, C(O)NH, SO2NH, or SO2; and R32 is C1-C18 alkyl, Ar3, or aralkyl). Claims also cover diketopyrrolopyrroles (DPPs) III [A4 = H], the preparation of III [A4 = C1-C18 alkyl or Ar3] by reaction of I with primary amines A4-NH2, and an addnl. preparation of III [A4 = H]. I can be obtained in high yield and high purity. The microwave-assisted process, optionally in the presence of an inert solvent, is rapid and economical. Previously, WO03022848 disclosed a process for the preparation of I, comprising heating a compound II in an inert solvent, such as aromatic solvents, like biphenyl, para-, meta- or ortho-terphenyl, dibenzyltoluene, α -methyl- or β -methylnaphthalene, cyclic carbonates like 1,3-dioxolan-2-one; ketones like acetophenone or benzophenone, γ -butyrolactone, and ethylene glycols like Phe-Cellosolve or Bu-Cellosolve, or mixts. thereof, in particular mixts. of di- and triaryl ethers (Dowtherm A). It was discovered that I can be obtained in higher yield by carrying out the above reaction under microwave radiation. The yield of the desired ring closure reaction, e.g., of Et 4-benzoyl-4,5-dihydro-5-oxo-2-phenylpyrrole-3-carboxylate (IV) to give 3,6-diphenylfuro[3,4-c]pyrrole-1,4-dione (V), is, for example, increased from 40% to 86% by microwave assistance. Moreover, the preparation of the latter lactone (a versatile DPP precursor) requires less time (1-10 min) under microwave irradiation, whereas it takes 60 h when conducted without microwave radiation (conventional method). In addition, the solvent can be omitted in the microwave-assisted ring closure, which makes the process even more cost-effective. For instance, 0.296 mmol IV was irradiated with microwave radiation at 2-45 GHz and forward power 300 W without solvent.

L8 ANSWER 2 OF 4 HCAPLUS COPYRIGHT 2007 ACS on STN (Continued)
 heating to 250° for 10 min. The crude product V was allowed to cool, triturated, filtered, and washed with MeOH (86% yield). The DPP compd. VI was prep'd. in 52% yield by condensation of the corresponding lactone (i.e., an analog of V) with PhNH2 in the presence of CF3CO2H and DCC at room temp. Finally, 5-oxo-4,5-dihydrofuran-3-carboxylates react with primary amines to give corresponding pyrrole derivs., which then react with nitriles A2-CN to give compds. III [A4 = H].

AB Et 2-aryl-4,5-dihydro-5-oxopyrrole-3-carboxylates, I (R = Ph, 4-ClC₆H₄) react with esters or acyl halides in the presence of a strong base to give 4-acyl derivs., e.g. II, which exist predominantly as either E- or Z-enols. These are cyclized, either in solution at temps. >200°C or by microwave irradiation, to 3,6-disubstituted 1H-furo[3,4-c]pyrrolediones, e.g. III, which, after N-protection, are convertible by reaction with primary amines into novel N,N'-disubstituted DPP derivs., e.g. IV.
